

The Single Location

Option One – The Single Computer

Suitability

This is suitable for a single user environment with only one location and no more than 50 resources.

Internet booking is possible but requires IIS to be installed and a router with adequate protection to allow access to web services hosted on the computer.

Recommended Requirements

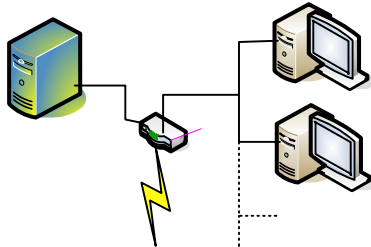

Windows XP Service Pack 2 or above

IIS*

Minimum 1 Gb RAM

SQL Server 2005 Full or Express Edition (Express Edition is Free)

Option Two – The Internal Network

Suitability

This is suitable for a single location which requires multiple users. Database and web services are on the server and the Probooker applications on the desktops.

Recommended Requirements

Desktops

Windows XP Service Pack 2 or above

Minimum 1 Gb RAM

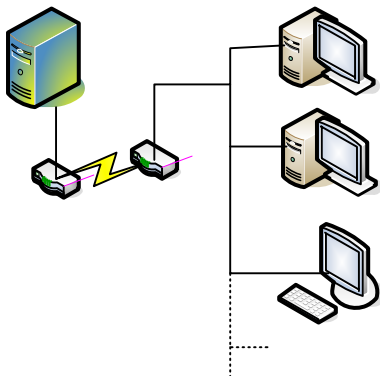

Server

SQL Server 2005 Full or Express Edition (Express Edition is Free)

IIS*

Multiple Locations

Option Three – Server Based Network

Suitability

This is suitable for multiple locations. With the use of Server Based technology the clients can be Windows, Linux or Mac based. They can also be Thin Clients.

Recommended Requirements

Desktops

Internet Browser (check Citrix for minimum requirements)

Minimum 1 GB RAM

Minimum 2 Mb ADSL Connection

Server

Windows Server 2003 or above

SQL Server 2005 Full

IIS*

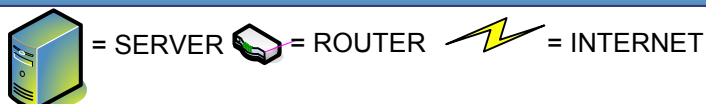

Citrix Xenapp

Option Four – Mixed Mode Network

Suitability

Where the Server Based Network is not available then a combination of the above environments is possible. For instance, there may be a location with very bad Internet connectivity in which case this location could have the application installed locally and the data on the server as with the Internal Network.

KEY

* IIS (Internet Information Server). This is required to run PAPI which is used for integration with other systems and online booking. IIS is supplied with XP Professional and on Vista Ultimate and Business Editions.
